Source not found reference not found

Similar worries reach into biology, where migratory songbirds are said to navigate by the quantum folding of circadian proteins in the retina [3].

No verbatim quote from the source backs a verdict.

The cited reference was not found.

c3 → ref 3 · Varkonyi et al. 2019, Quantum folding of migratory songbird circadian proteins

---

Not supported

Ioannidis proved that all published research findings are false [2].

“It can be proven that most claimed research findings are false.”

Ioannidis argues that most (not all) published findings are likely false, and this depends on factors like power, bias and prior odds.

● Supported

Residual learning eases the training of networks that are substantially deeper than those used previously [1].

“We present a residual learning framework to ease the training of networks that are substantially deeper than those used previously.”

The abstract states almost verbatim that the residual learning framework eases training of networks substantially deeper than those used previously.

c1 → ref 1 · abstract only · He et al. 2016, Deep residual learning for image recognition · source (https://doi.org/10.1109/cvpr.2016.90)

How verdicts work

References	Looked up in Crossref, OpenAlex, arXiv, Semantic Scholar and doi.org. Title, authors, year (±1) and DOI are compared by code, not by a model.
Claims	Each citing sentence is read against the cited paper: full text where open, otherwise the abstract; each row says which.
Evidence	A verdict is shown only with a quote of at least 5 words found verbatim in the source. Without one, the claim reads “Not enough evidence”, which is never counted against you.
Two readers	A judge and a skeptic on different model providers. If they disagree, the claim is flagged “Needs review” and the more cautious verdict is kept. If one of them is unavailable, the row says “judge only” or “skeptic only”.
Could not check	A lookup or model failure is never a finding: it is shown as “Could not check”, not as a problem with the manuscript.

ClaimTrace: automated citation audit. Every verdict needs a human check against the source before you rely on it.
